

Le LVD82 surveille les teneurs en tritium dans les eaux, principalement en aval de la centrale nucléaire de Golfech.

Le tritium est un isotope radioactif de l'hydrogène, mesurable dans l'eau. Il peut être d'origine naturelle, mais sa présence dans l'environnement est surtout liée à l'activité humaine :

- les essais aériens d'armes nucléaires entre 1945 et 1963,
- les centrales nucléaires où le tritium est formé dans le réacteur par fission de l'uranium ou du plutonium,
- les usines de retraitement des combustibles usés et de charge des réacteurs,
- d'autres installations industrielles (par exemple agent de scintillation dans les peintures luminescentes pour l'horlogerie), des centres de recherche et universitaires, des hôpitaux ainsi que des installations militaires.

• **En savoir plus**

En France, le tritium est suivi comme indicateur de radioactivité dans les eaux de consommation. En effet, au-delà d'un niveau de référence de 100 Bq/litre, il est procédé à l'identification et à la quantification des radionucléides artificiels [...] " (*arrêté du 12 mai 2004 fixant les modalités de contrôle de la qualité radiologique des eaux destinées à la consommation humaine*).

En Tarn-et-Garonne, l'arrêté du 18 septembre 2006 autorise l'exploitant du site nucléaire de Golfech à rejeter des effluents liquides. Article 19, paragraphe IV : « L'activité volumique mesurée dans l'environnement (...) ne doit pas dépasser » pour le tritium en « moyenne journalière 140 Bq/litre ».

• **Les résultats**

Le LVD82 a révélé la présence de tritium dans les eaux de Garonne à l'aval du site nucléaire, et dans certaines eaux potables prélevées à Agen, mais à des valeurs inférieures au niveau de référence de 100 Bq/l (*arrêté du 12 mai 2004 fixant les modalités de contrôle de la qualité radiologique des eaux destinées à la consommation humaine*).

Figure 1. Results of the 2006 Survey of the Health of the Nation

The figure consists of three parts: a map of the United Kingdom, a table of survey results, and a bar chart showing the percentage of respondents who reported various health conditions.

Map of the United Kingdom: The map shows the four countries of the United Kingdom: England, Scotland, Wales, and Northern Ireland. The survey was conducted in 2006.

Table of Survey Results:

Health Condition	Percentage of Respondents
Obesity	25.0%
Diabetes	10.0%
High Blood Pressure	20.0%
Cholesterol	15.0%
Depression	12.0%
Stress	18.0%
Smoking	22.0%
Alcohol	10.0%
Exercise	15.0%
Healthy Diet	18.0%
Overall Health	75.0%

Bar Chart: The bar chart shows the percentage of respondents who reported various health conditions. The x-axis represents the health condition, and the y-axis represents the percentage of respondents. The bars are colored in shades of blue and green.

Figure 1: Relationship between the number of children in the household and the number of children in the school

The figure consists of four scatter plots arranged in a 2x2 grid. The top row shows the relationship for the year 2000, and the bottom row shows the relationship for the year 2005. The left column shows the relationship for the year 2000, and the right column shows the relationship for the year 2005. Each plot includes a regression line and a confidence interval. The x-axis for all plots is 'Number of children in the household' (ranging from 0 to 10) and the y-axis is 'Number of children in the school' (ranging from 0 to 10). The plots show a positive correlation between the number of children in the household and the number of children in the school. The correlation is stronger in 2005 than in 2000.
